***WCO Global Forum on Origin Interconnectivity***

3-4 February 2025

## Challenges in establishing interconnectivity:

- Different CO data requirements between one contracting party to another
- Different technical standards and specifications introduced by other contracting parties
- Different procedures of issuance and handling of CO in different contracting party.

## Globally Networked Customs

The **voluntary** arrangement between two or more Members for a **seamless exchange** of cross border information at a Customs to Customs level using a **standardized** approach based on existing WCO instruments

By **gradually** moving away from the current individually **hand-crafted** method for negotiating **International Agreements** and using a disciplined and common methodology to **industrialize** the process

## GLOBALY NETWORKED CUSTOMS Segments

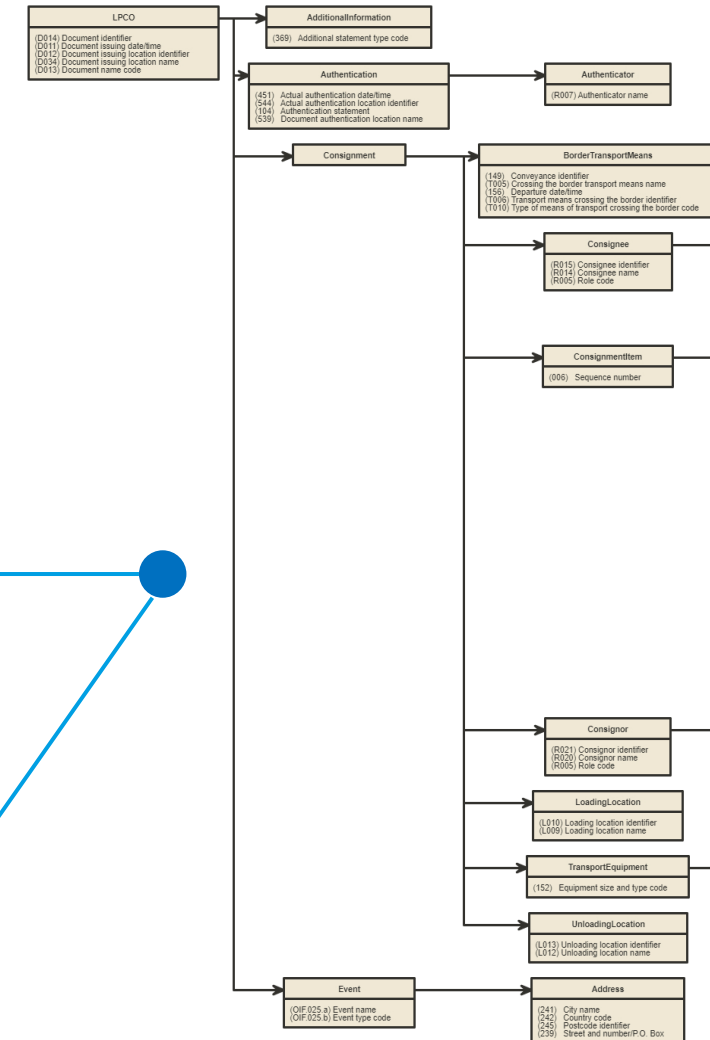

### Regulatory and Legal Framework

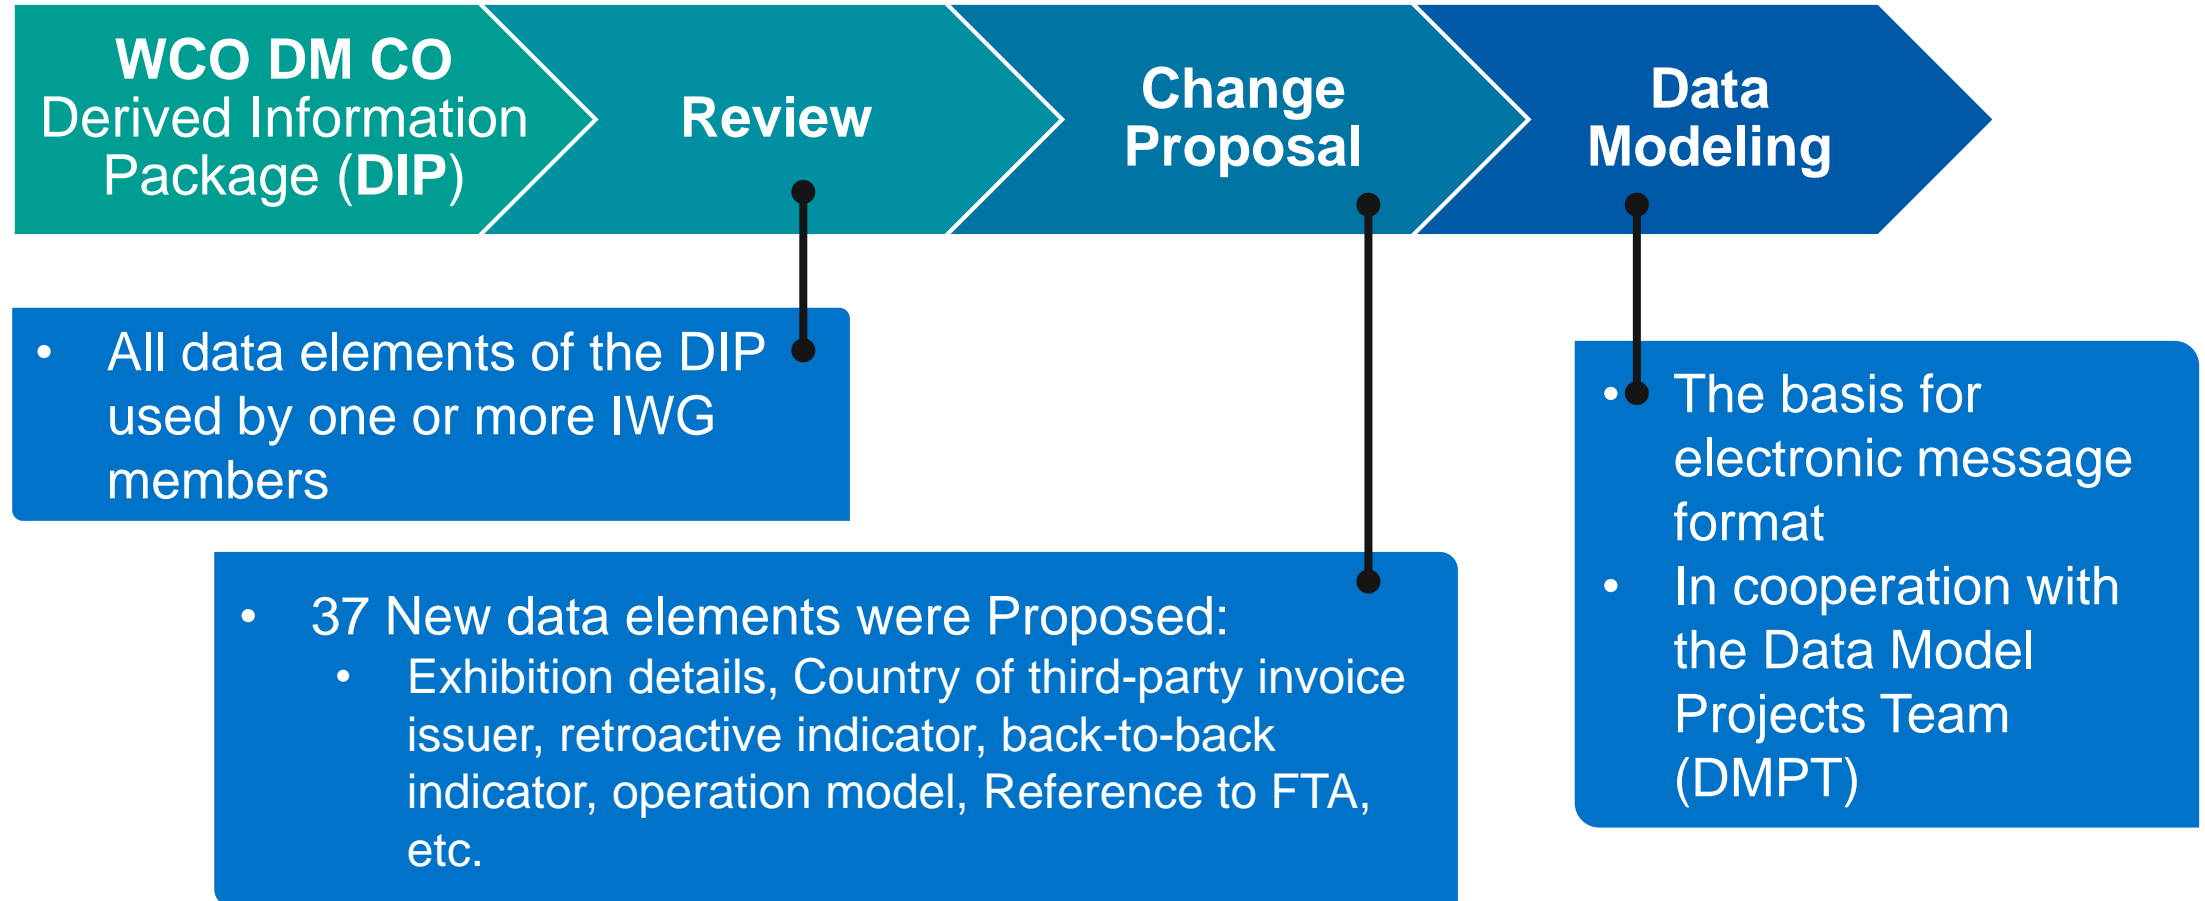

#### Process Alignment

- Entities
- Trigger
- Process flow/business rules
- **Data Cluster**

#### Technological Interoperability

- Systems integration architecture
- **Systems interface**
- Network communication
- Security

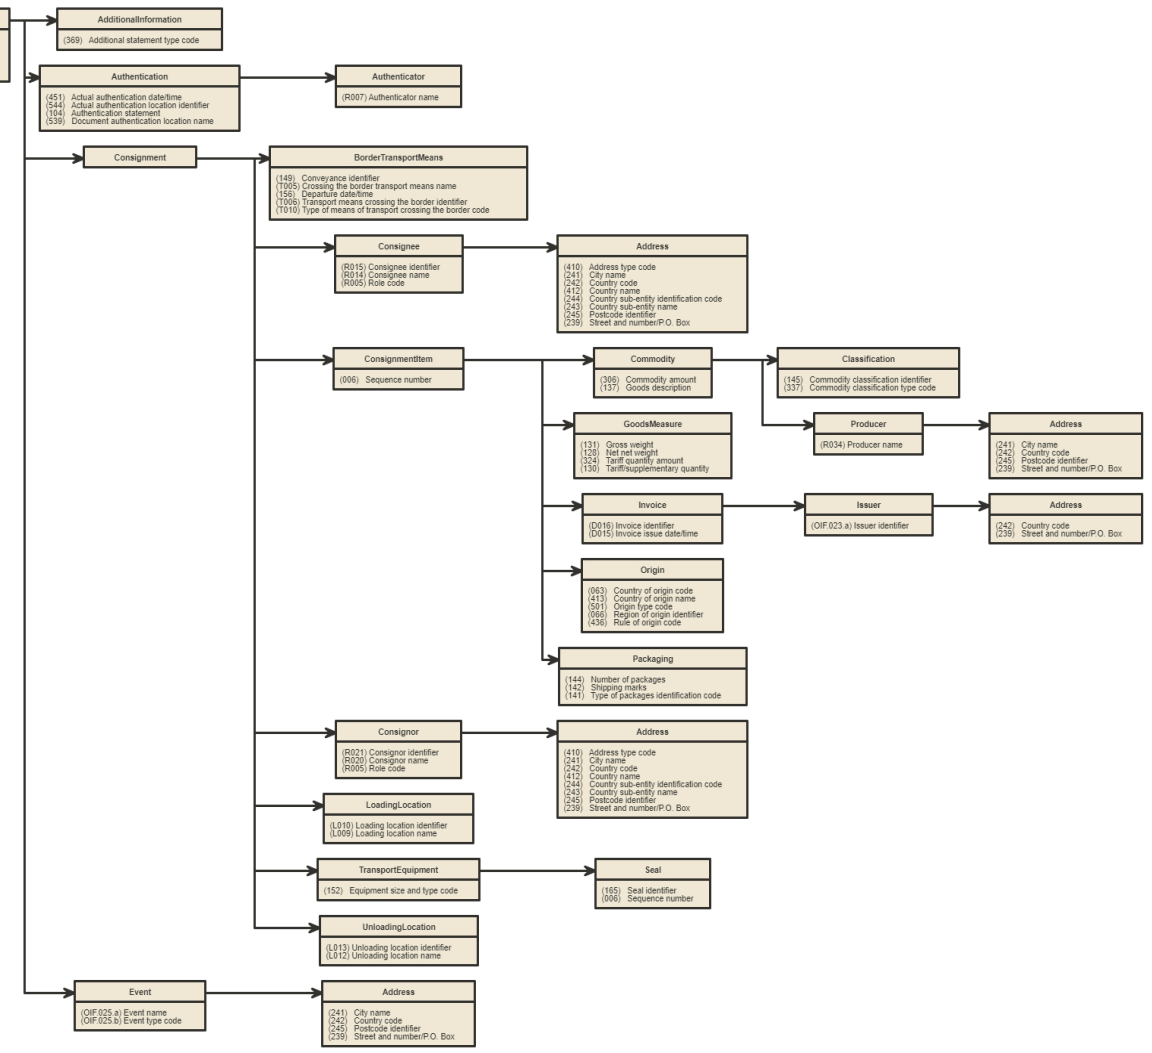

# 4. Dataset for e-CO

Available on the WCO DM App:

- <https://datamodel.wcoomd.org/#/mydataset/code/mapping/e448a5c010>
- <https://datamodel.wcoomd.org/#/infopack/scope/national/bceed8417e>

Name	HWG	DIP	Path	Mapping Notes
Document issuing date/time	OIF.001		LPCO/Document issuing date - (D011)	
Document name code	OIF.002		LPCO/Document name, coded - (D013)	
Authentication	OIF.003		LPCO/Authentication	
Authentication statement	OIF.003.a		LPCO/Authentication/Authentication - (104)	
Document authentication locat...	OIF.003.b		LPCO/Authentication/Document authentication location name - (539)	
Authenticator	OIF.004		LPCO/Authentication/Authenticator	
Authenticator name	OIF.004.a		LPCO/Authentication/Authenticator/Authenticator - name - (R007)	
AdditionalInformation	OIF.004.b		LPCO/AdditionalInformation

# GNC: seamless interconnectivity using international standard

## National Implementation

## Service Endpoint Pattern

Ensure consistency of service endpoint by standardizing how each part of the endpoint using certain pattern. The pattern allows implementer to configure single gateway to connect with multiple partners

`https://{environment}.coconnect.{domain}/{service_operation}`

Variable	Definition	Example/possible value
<b>environment</b>	The server environment where the system is deployed	<ul style="list-style-type: none"><li>• dev (Development)</li><li>• test (Testing)</li><li>• prod (Production)</li></ul>
<b>domain</b>	The domain name of the API	e.g., customs.go.kr, beacukai.go.id, aduana.gub.uy
<b>service operation</b>	The service operation as defined in the Service Operation section, lower cased and kebab cased (all spaces are replaced with dash character)	send-co

## Service Operation Name

Ensure consistency of service endpoint by standardizing the name of service operation derived from the data exchange interaction described by the sequence diagram of the business process model.

Variable	Definition	Client	Service Provider
send-co	Send CO data	Outbound gateway	Inbound gateway
send-amendment-notification	Send amendment notification	Outbound gateway	Inbound gateway
send-cancelation-status	Send cancelation status	Inbound gateway	Outbound gateway
send-feedback	Send origin treatment feedback	Inbound gateway	Outbound gateway

## Interface Protocol and Message Format

The interface protocol, such as Webservice, WebAPI or Message Queue determine how messages travel between two or more systems, while message format, such as JSON, and XML defines what the message looks like when it is to be passed from one system to another

## Coded values

concise string of characters that represents a piece of information. Coded value helps to avoid errors when providing information that would otherwise have to be represented by longer text with a higher probability of error.
