

# Enhancing Interoperability Beyond Data Exchange

Bridging the Gap between National Customs  
Systems and Field Operations

Presented by

**Jeongmin AHN**

Strategic Business Office, KCTDI

# 1. E-commerce Growth and Customs Responses

## The Challenge

- Sharp increase in small, diverse, and low-value express consignments
- Growing pressure on existing customs clearance systems

## Global Customs Responses

- Enhanced digitalization and data-driven risk management
- Increasing adoption of AI-supported customs operations

## International Standards

- Structured data requirements (*WTO TFA*)
- Risk-based clearance procedures (*WCO Revised Kyoto Convention*)

→ Supporting proactive customs adaptation

## 2. The Emerging Challenge: Customs-Field Data Gaps

### Two Different Challenges

- Enhanced e-clearance & ACI-based risk analysis
- Real-time integration with field-level logistics flow

### Field-Level Data Gaps

- Time gaps between physical cargo movement and system updates
- Fragmented data across transport, storage inspection, and release stage

### Result

- Weakened real-time inventory visibility and cargo control
- Increased reliance on manual checks and delayed verification

 **Key Issue:** Lack of real-time, end-to-end data synchronization between national customs systems and field operations

### 3. Korea's Approach: A Public-Led Cooperation Model

#### Public-Led Governance Model

- KCS provides the policy framework and national customs system (UNIPASS)
- A non-profit operator (KCTDI) manages on-site clearance operations
- Support customs inspections and address risks such as tax evasion and hazardous goods

#### <Collaboration Model>

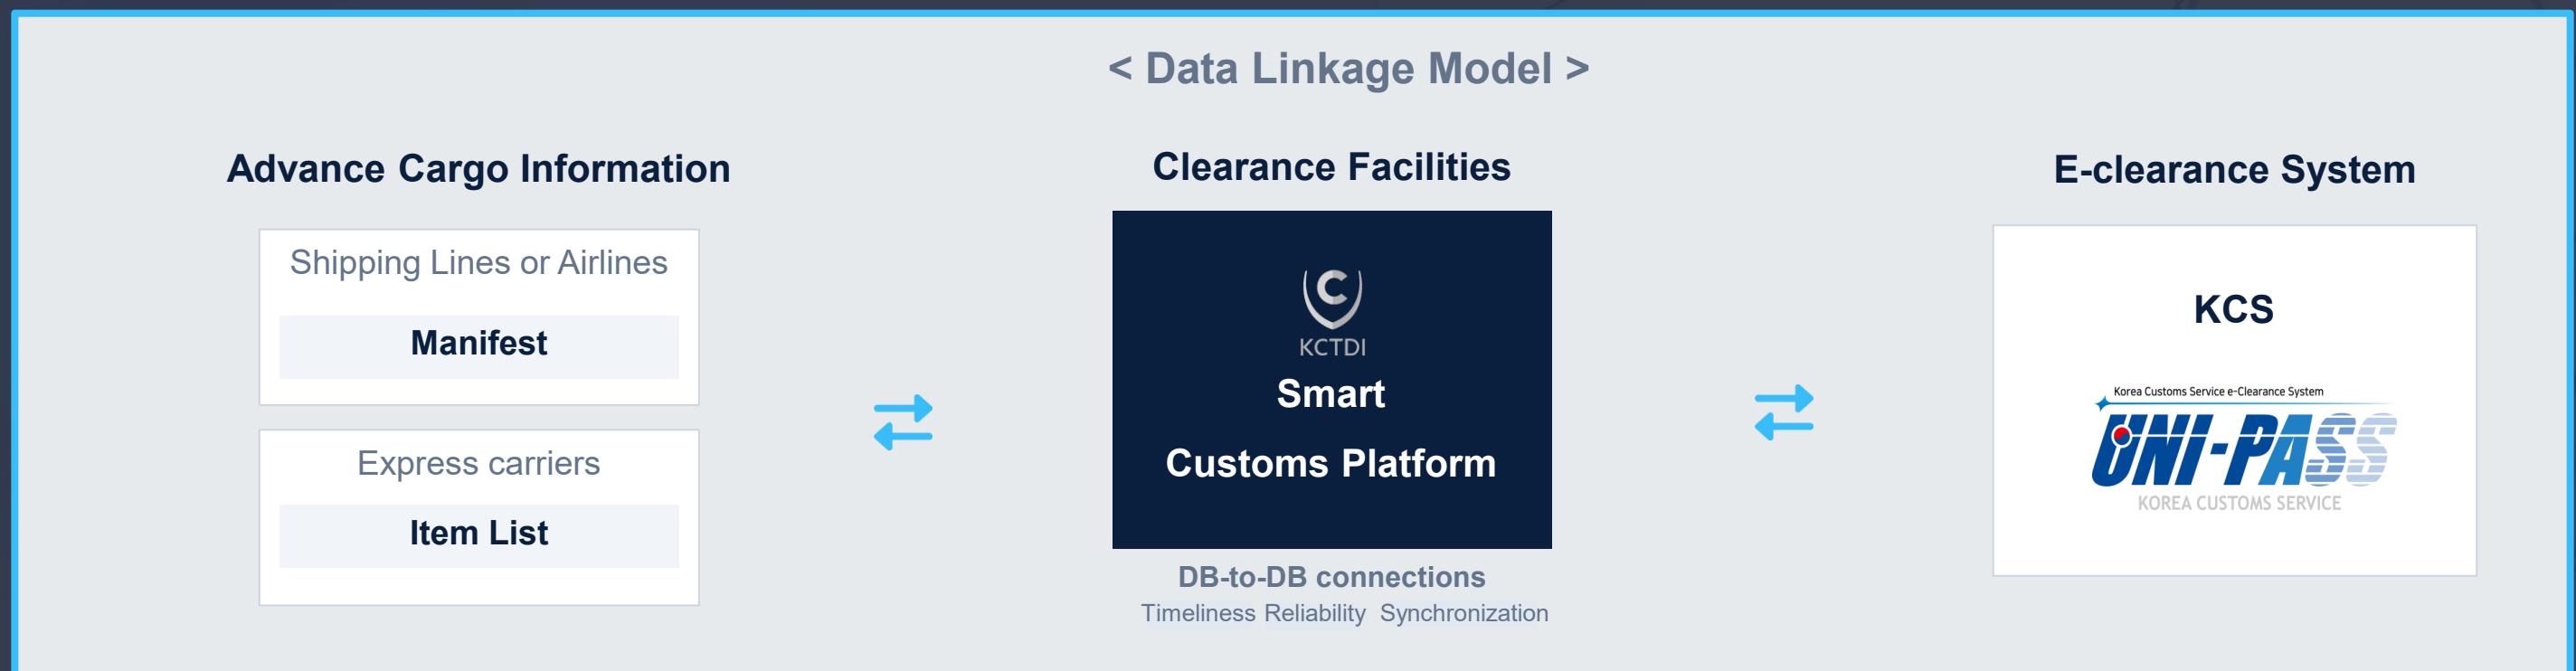

# 4. Integrating UNIPASS with Smart Customs Platform

## From E-declaration to On-site Operations

Data linkage expanded to customs clearance facilities

### Role of Platform

- Integrated data hub connecting on-site operations with UNIPASS
- Real-time exchange of cargo data and inspection results

## 5. Extending Data Connectivity after Customs Clearance

### Extend Data Linkage to Door-to-Door(D2D) Logistics

→ Key to addressing data discontinuity

#### Strengthening Post-Clearance Risk Management

- Exceptional cases(*e.g. misrelease, unforeseen situations*)
- Post-clearance data linkage **enables**
  - Tracking of cargo routes, delivery status, consignees

#### Improving Service Quality and Operational Efficiency

- Real-time clearance-to-delivery data flow
  - Enhanced ETA/EDD accuracy
  - Reduced waiting time & fewer manual checks
  - More efficient resource allocation(*vehicles, staff, warehouse operations*)

 **End-to-End Data Integration = Safer, Faster, More Cost-Effective Logistics**

# Thank You
